

Accident Report Analysis 2021 vs 2022

Project Overview

This report presents a comprehensive analysis of road accident casualties across the years 2021 and 2022. The purpose of this analysis is to understand trends, identify high-risk factors, and highlight key insights using visualizations. The dashboard supports data-driven decisions by providing filters for **accident date** and **location**.

Key Performance Indicators

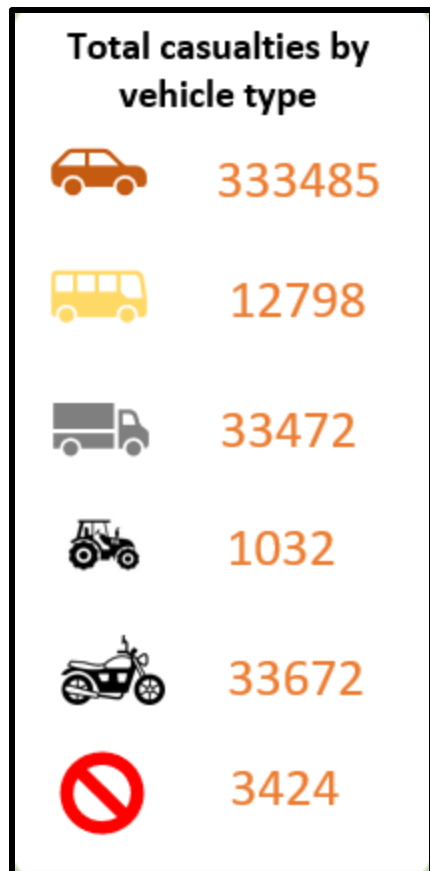

1. Total casualties - This metric provides a quick glance at the overall severity of road accidents.

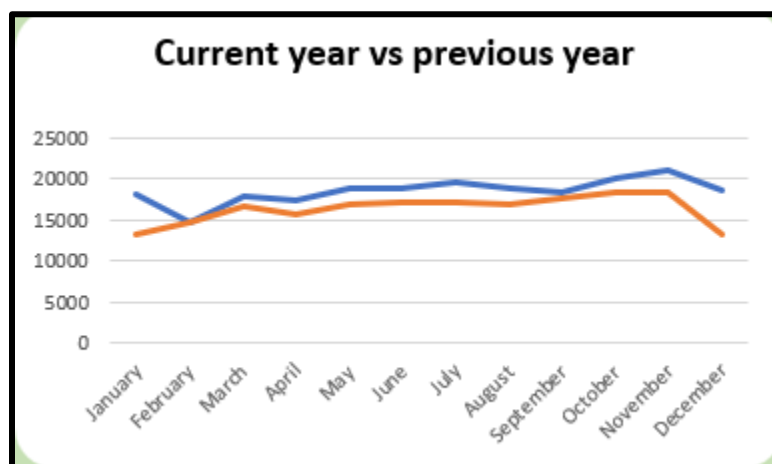

2. Casualties by Accident Severity and Vehicle Type - Identifies the most dangerous vehicle types and the impact of severity levels on casualty count.

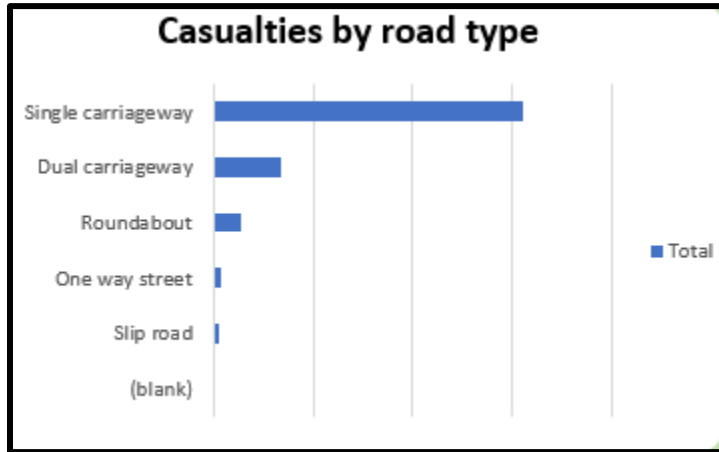

3. Casualties by Vehicle Type – It is showing casualties split by different vehicle types. Cars are observed as the most casualty-prone vehicle, indicating a need for stricter driver behavior monitoring and enforcement.

4. Monthly Trend (Line Chart) - Line chart comparing month-wise casualties for 2021 and 2022.

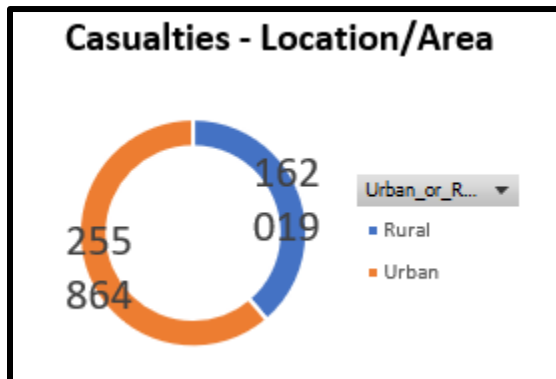

5. Casualties by Road Type (Bar Chart) - Identifies roads with higher risk and helps urban planners focus on safer infrastructure design.

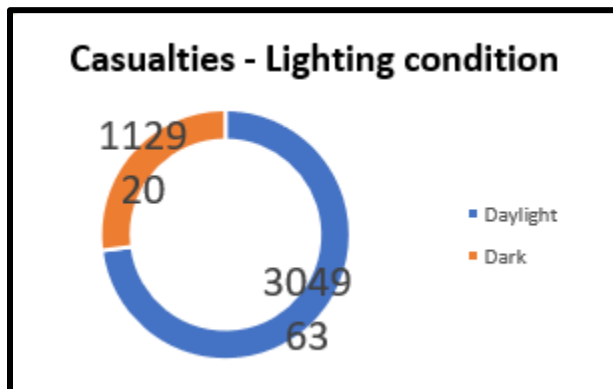

6. Casualties by Road Surface (Treemap) - Treemap offers a compact way to highlight road conditions that lead to more casualties.

7. Casualties by Location (Donut Chart) - Donut chart showing regional/city-wise breakdown

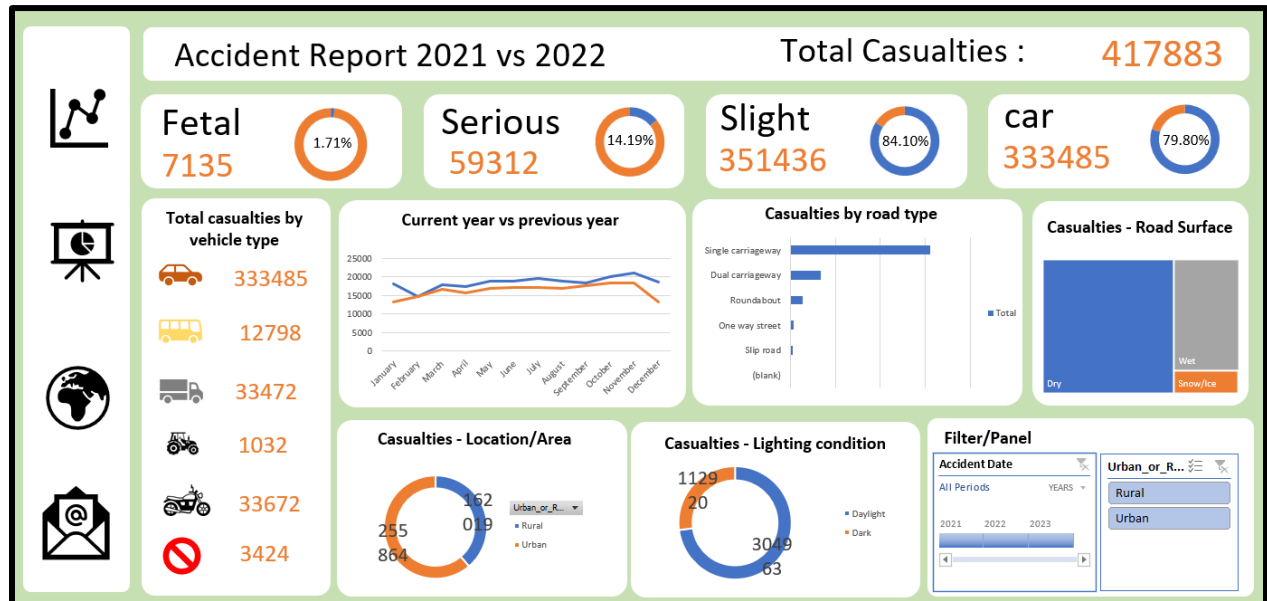

8. Casualties by Light Condition (Donut Chart) - Highlights time-of-day risk patterns.

Filter Pane:

- **Accident Date:** Allows users to select specific time periods for analysis.
- **Location:** Helps zoom into specific cities or regions for focused insights.

Dashboard

Key Recommendations

1. **Increase safety awareness** for car drivers, especially during peak months.
2. **Improve lighting** and road signage in accident-prone areas.
3. **Focus infrastructure investments** on high-casualty road types.
4. **Conduct regular maintenance** to reduce accidents uneven road surfaces.
5. **Enhance enforcement** in regions and times with high accident frequency.

Conclusion

The dashboard provides a multi-dimensional view of accident casualties for 2021 vs 2022. By examining severity, vehicle type, environmental conditions, and temporal patterns, stakeholders can prioritize interventions for improving road safety.
